

# Injection Apertures in IP2 and IP8: VCTY Problem

- ◆ Aperture problems in IP2 and IP8 at the recombination chambers VCTYB (IP2) and VCTYA (IP8)
  - ◆ Apertures of the chambers do not take into account the
    - ◆ Non kicked injected beam
    - ◆ Kicked stored beam
  - ◆ Initially noticed and followed up by Bernard Jeanneret
- ◆ Here only IP2 treated, problem is similar for IP8
  - ◆ Chamber IP8 is less complicated (type VCTYA instead VCTYB)
- ◆ BJ also signalled problems at the BPM chamber in front of D2
  - ◆ Also contacted BI to increase chamber diameter

# Layout IP2

# VCTYB chamber

Side view

Critical aperture,  $R = 25.8$  mm (incl. off-set)

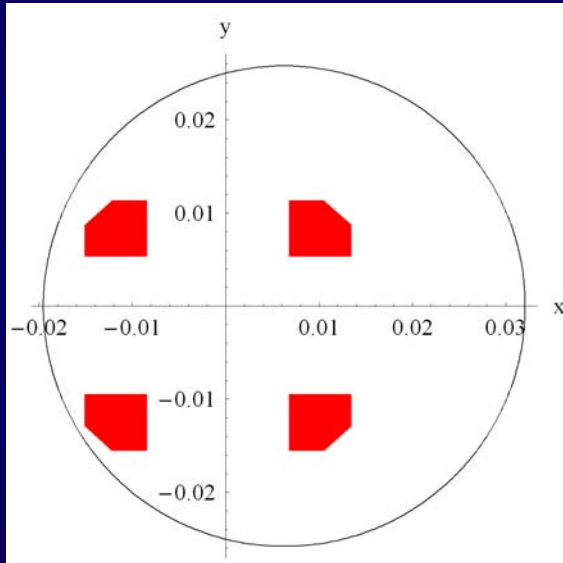

Top view

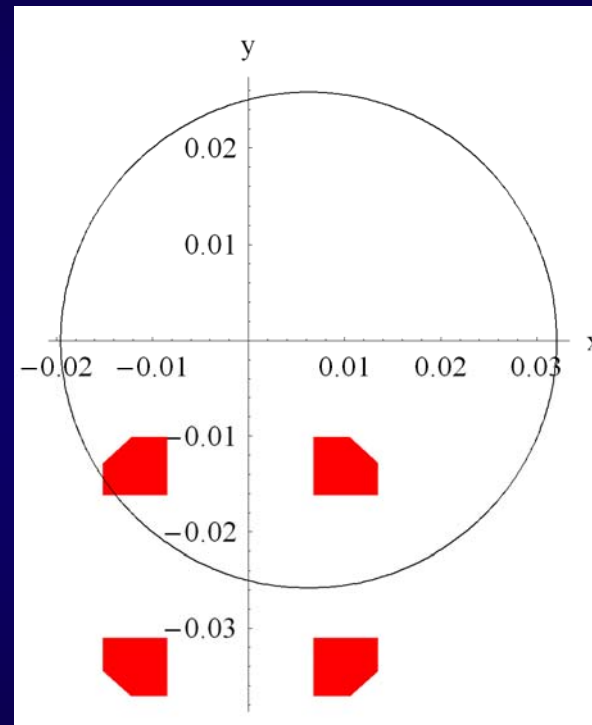

# Apertures For the Stored Beam

Calculations for optics V6.500  
Injection onto bumps / separation

Normally stored beam is ok.  
Large effective off-set of vacuum  
chamber rel. to the beam

Stored beam kicked by injection  
kicker: missing aperture about  
15 mm

# Injected Beam

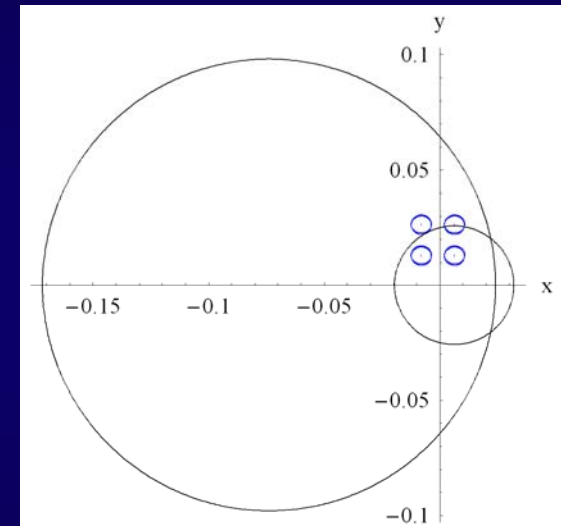

Normally injected

*Need to add 4 mm more vertical aperture if V-crossing changes sign*

Injected, not kicked

Comparison chamber at critical position and larger chamber downstream

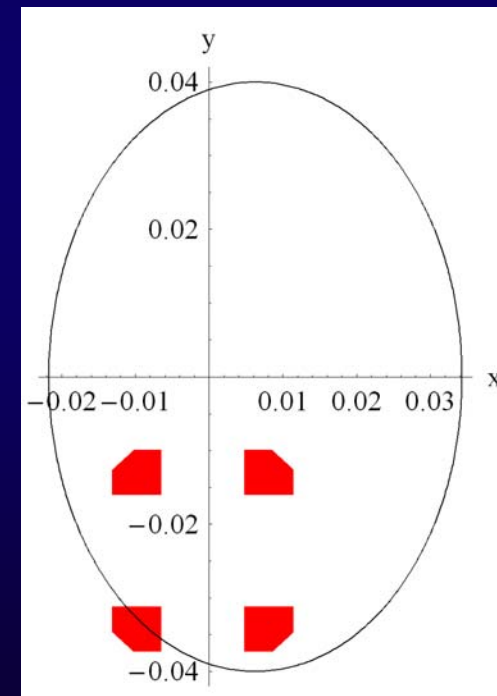

# Modifications

- ◆ BJ proposes two possible chambers, discussed with Christian Rathjen
  - ◆ Racetrack or ellipse
  - ◆ 28 x 38 or 28 x 40

Enlarged chamber ellipse of 28 mm x 40 mm, 2 mm closed orbit,  $n_1 = 7$ : still seems to be a bit tight.

Acceptable, or can it be a bit larger?

What is the constraint?

*... check injected on different orbit...*

# Future Actions

- ◆ Agree on VTCY chambers for IP2 and IP8 required
  - ◆ Approve mechanical drawings (ECR)
- ◆ Idem BPM chamber just after D2
  - ◆  $D = 60 \text{ mm}$  to  $D = 80 \text{ mm}$  (on same ECR?)
- ◆ When can the modified chamber(s) be installed in IP2 and/or IP8? Before the 2007 LHC operation with beam?
  - ◆ Presentation LTC next Wednesday by JB, two supporting slides BT
  - ◆ Need to see the non-kicked injected beam on the BTV at the TDI for setting up injection
  - ◆ Can not risk to be limited in intensity due to damage limit of the VTCY chamber
  - ◆ Radiation hygiene: want to dump on TDI not on chamber
